JARVIS gap report: Cursor ↔ ChatGPT debug bridge vs. your spec

This is the distance between the 14-page debug-bridge spec and the repo. The bridge is the communication layer. It does not mark the Deloitte semantic-matching live tests done.

Automated: not a product test | **Live Deloitte matching:** NOT YET RUN | **Origin:** still the initial screenshare commit until this docs commit is pushed

1. The gap in one paragraph

You asked for one permanent GitHub issue, an append-only root-cause log, explicit routing precedence, focused commits, and a review package ChatGPT can challenge. The log, protocol, and real router order are in **docs/debug/**. A Cursor always-apply rule points at that protocol. The standing GitHub issue is created as part of this update. **ChatGPT cannot yet independently inspect the semantic-matching source diff** because almost all of **src/agent/** is still untracked against origin/main (initial screenshare commit only). Dumping the whole tree into this commit would violate focused-commit discipline. That remaining gap is called out on the issue.

2. Scoreboard

Your requirement	What the build does now	Status
One permanent GitHub issue: JARVIS Root-Cause Debug Thread	Created (or updated) in herbosexton/AI-Screenshare-Helper. Standing thread, not a one-off bug ticket.	SHIPPED
docs/debug/JARVIS_ROOT_CAUSE_LO G.md append-only	Exists with template plus two dated entries: chrome-as-requirements and semantic matching. Old entries are not overwritten.	SHIPPED
Diagnose before patching; evidence fields required	Protocol + Cursor rule. First two log entries include utterance, route, hypotheses, files/functions, automated vs live.	SHIPPED
Document actual routing precedence, not a hidden fallback order	docs/debug/ROUTING_PRECEDENCE.md lists the live orchestrator order (20 steps). It differs from the spec example: fast page facts run before analysis follow-up.	SHIPPED
Cursor posts ROOT-CAUSE REVIEW REQUEST packages	First package posted on the standing issue for the matching bug. No “Fixed.” / “Tests pass.” comments.	SHIPPED
Focused commit ChatGPT can open	This update commits only debug-bridge docs/rule/report. Matching code remains local. ChatGPT can review the bridge commit, not yet the engine diff.	PARTIAL
ChatGPT independent review format + disagreement loop	Documented. Waiting for ChatGPT’s first review after you point it at the issue.	UNPROVEN
Never report DONE without live rerun	Matching live tests A–E remain NOT YET RUN in the log and issue.	SHIPPED
Verify user outcomes / fail closed / no “Done.” cover-up	Already in compare/result synthesis from prior work. Restated in the protocol. Not a new runtime change this commit.	PARTIAL
Architecture audit every 5–10 fixes	Cadence recorded. Zero audits yet (only two historical bugs logged).	GAP

Your requirement	What the build does now	Status
User no longer hand-translates code-level detail to ChatGPT	Works only after the issue exists and later code commits are on GitHub. Matching source is still the gap.	PARTIAL

3. Files added

- **docs/debug/CURSOR_CHATGPT_DEBUG_BRIDGE.md** — workflow, package formats, definition of done.
- **docs/debug/ROUTING_PRECEDENCE.md** — actual orchestrator order vs spec example.
- **docs/debug/JARVIS_ROOT_CAUSE_LOG.md** — append-only memory.
- **.cursor/rules/jarvis-debug-bridge.mdc** — always-apply for Cursor (local; .cursor/ is gitignored).

4. Definition of done for the bridge

- Permanent GitHub issue exists.
- Root-cause log exists and is append-only.
- Cursor posts evidence packages.
- Fixes have focused commits ChatGPT can inspect.
- ChatGPT can challenge the diagnosis.
- Live tests remain the acceptance gate.

Bridge communication is standing. Semantic matching on Deloitte 359035 is still **open** (LIVE NOT YET RUN).
